

USE	SOWING RATE	ENDOPHYTE LEVEL	BENEFITS	RATING
Golf courses	30-40 (g/m²) (20-30 when oversowing)	High	Dark green colour	Turf quality
Sports fields			Strong drought recovery	Genetic colour
Parks & reserves			Early spring green-up	Wear tolerance
Home lawns			Excellent turf quality	Gray Leaf Spot
Landscaping			Disease resistance	Wear tolerance

KARMA perennial ryegrass (PICK 10401) has superior Gray Leaf Spot resistance and demonstrates excellent germination. It was the highest rated perennial ryegrass for Gray Leaf Spot resistance in 2 NTEP trials. It has demonstrated superior germination, establishment and growth in areas with severe summer stress. In the NTEP trials to date, it is a top performer under all maintenance situations and was selected as a control in the next NTEP due to superior performance.

For overseeding, KARMA has performed exceptionally well in trials where the characteristics measured were establishment, cover, quality, colour, and winter quality. Superior growth under cool conditions means excellent winter performance. It also had excellent Brown Patch resistance. Combine that with good *pythium* resistance, very good Pink Snow Mould resistance and excellent summer density and KARMA will fit the bill for any application.
